a correspondence hierarchy

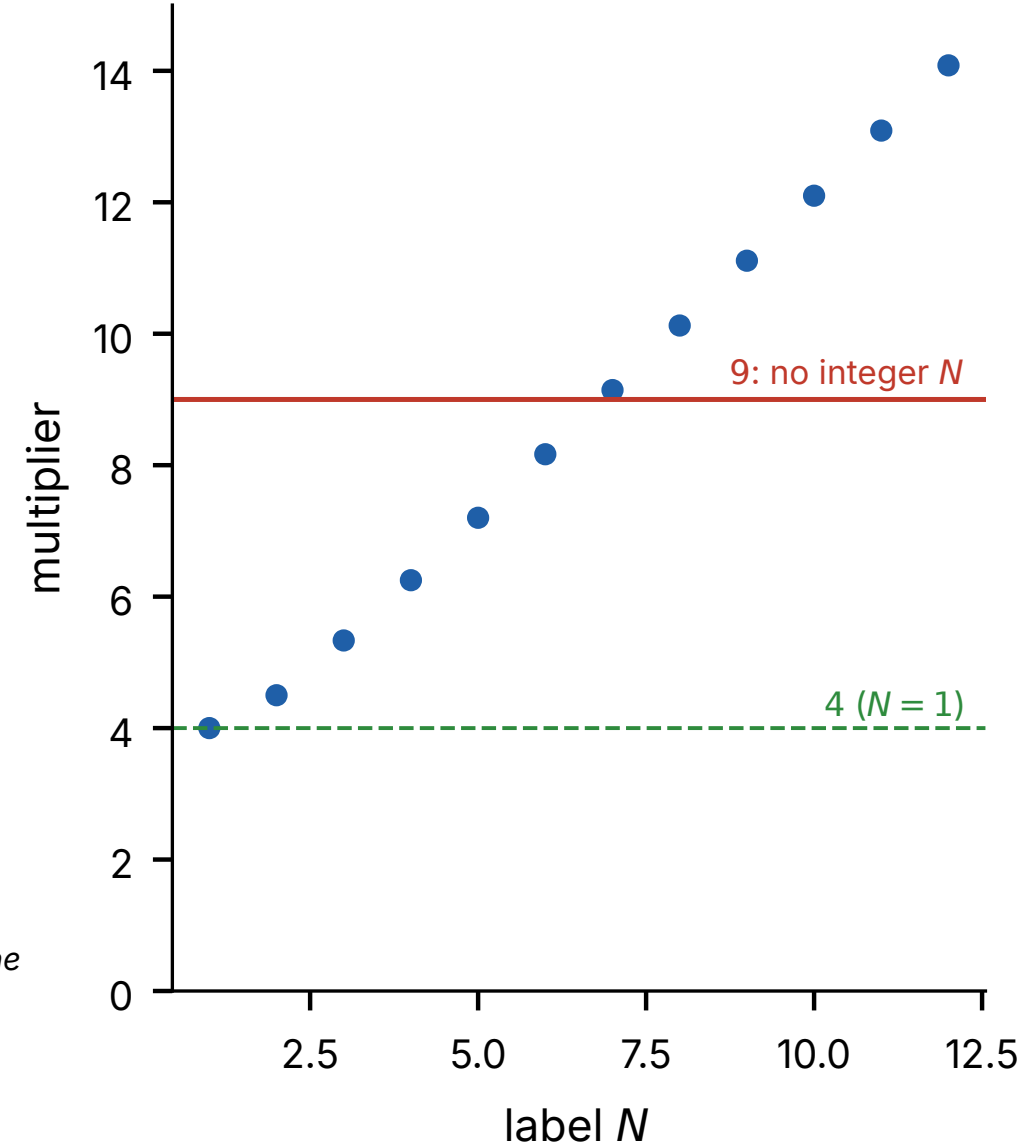
L5 dynamical intertwining
not available (domains differ)

L4 geometric structures
only at endpoints

L3 reduced event records
N=1,2,5 ($G=11$); N=1 ($G=5$)

L2 occurrence information
implied by L1 at endpoints

L1 numerical ratio
$x_m = R(N)x_n$

each level is tested separately; none is inferred from a weaker one


b $R(N) = (N+1)^2/N$
