a histories of $\{2, 4, 5, 9\}$ from source 4; endpoint 9000

component 1 ($I = 1$)

component 2 ($I = 0$)

b finite-exact rows

A	endpoint	comp.	I-values
$\{5, 9\}$	9000	2	$\{0, 1\}$
$\{5, 9, 3\}$	48000	3	$\{0, 1\}$
$\{5, 9, 3, 6\}$	392000	3	$\{0, 1\}$

I = [2 before 4] is constant on every swap class. It is not a complete invariant: for $A = \{3, 5, 9\}$ there are 3 components but I takes two values.
