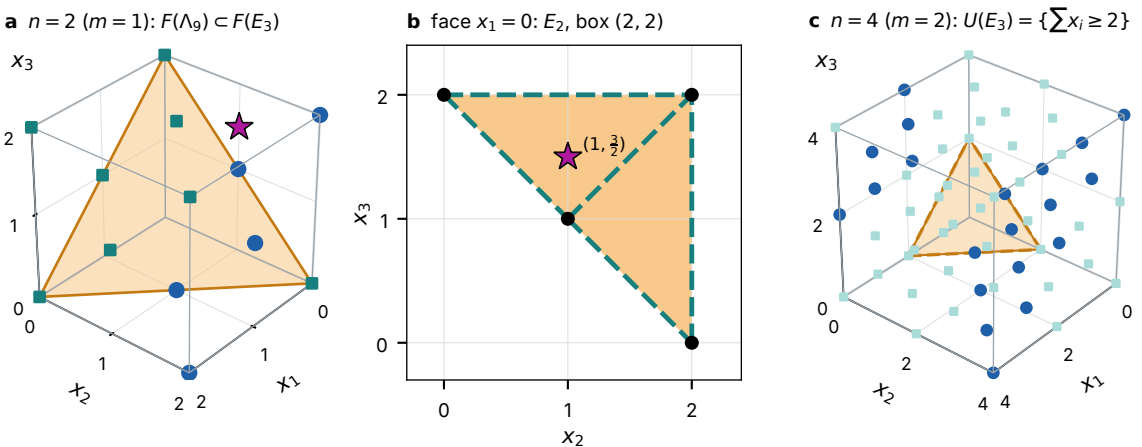
P4-F110: $x_m = 2 \cdot 110^{4m}/9 \to 110^{4m}/3$, $\Lambda_9 = \{a - b + c \equiv 0\ (6)\} \subset E_3$, $Q_m = [0, 2m]^3$



(a) blue: $F(\Lambda_9)$, teal squares: $F(E_3) \setminus F(\Lambda_9)$; the orange triangle $x_1 + x_2 + x_3 = 2$ is the cut of conv $F(E_3)$, and the star is the exact gap point $(0, 1, \frac{3}{2})$ lying in no cell. (b) its trace in the planar hollow-box face. (c) for $n = 4$ the union equals conv $F(E_3)$ (hull theorem; $n = 4$ by the cited certificate), so every source union is contained.
